ò
complimentary peptide nucleic acids (PNAs), (e.g. AAT89234). PNAs hybridise specifically to an RNA component of mammalian telomerase, and include the sequence GGG for specific hybridisation to the template region of this component. PNAs can be used as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, especially in the treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /mod_base= OTHER

antisense oligonucleotides specifically hybridise to a nucleotide sequence within an accessible region of the hTR, but that does not sequence within an accessible region of the hTR, but that does not consider to a sequence within the template region of hTR. These oligonucleotides may specifically be used for detection of an RNA component of human telomerase in a sample. This is useful for diagnosing cancer (especially neuroblastoma, bladder, colon and prostate cancer), and providing prognosis for a cancer patient. The inhibitory oligonucleotides can inhibit the telomerase activity level in a cell by the transcription of the RNA component, decreasing the half-confidence of the component transcript, inhibiting assembly of the component into the telomerase holoenzyme, or inhibiting the polymerase activity of telomerase. These antisense oligonucleotides can be used for inhibiting telomerase activity in both cultured cells and in cells in vivo. They can be used in therapeutics for treating or preventing cancer, for contraception or sterilisation, for immunosuppression, and for selectively down-regulating specific branches of inflamma system, e.g. a specific subset of T-cells, in anti-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a mammalian telomerase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                         This sequence is a novel peptide nucleic acid (DNA), which acts as an inhibitor of mammalian, preferably human, telomerase. The PNAs hybridise specifically to an RNA component of mammalian telomerase, and include the sequence GGG for specific hybridisation to the template region of this component. PNAs can be used as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         - used for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           for treating cancers, contraception,
                                                                                                        New peptide nucleic acids hybridising to mammalian telomerase RNA - used to inhibit telomerase, for treating tumours and other proliferative diseases, also for diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RNA component; human telomerase; antisense oligonucleotide; infection; neuroblastoma; bladder cancer; colon cancer; prostate cancer; cancer; contraception; sterilisation; immunosuppression; therapeutic; hTR; immune system down-regulation; anti-inflammatory therapy; ss.

The present sequence to the many component of the processe, and inhibits to telomerase activity. Telomerase is a ribonucleoprotein enzyme that synthesizes once strand of the telomeric DNA, using as a template an 11 nucleotide sequence contained within the RNA component of the enzyme. The nucleotide sequence contained within the RNA component of the enzyme. The invention relates to PNA molecules having a sequence of no more than 25 bases, which include the sequence GTTAGG. The uncharged nature of the PNA backbone increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and affords greater resistance of degradation by processes or nucleases. The therapeutic PNAs may be used for treating disease conditions such as cancers neoplasia, hyperplasia, neurodegenerative diseases, aging, human immunoseficiency virue (HIV) infection/AIDS (acquired immunodeficiency syndrome) and associated pathologies, fungal infections, and other cytooxic or diseases characterized by abnormal telomere metabolism or telomerase activity, in combination with antineoplastic and other cytooxic or cytostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization of individuals, e.g. paternity testing, based on hTR gene restriction of individuals, e.g. paternity testing, based on hTR gene restriction fragment length polymorphism (RPLP) pattern. PNAs are also useful as probes to detect the RNA component of amammalian telomerase and as allows cancerous conditions to be detected with increase and as allows cancerous conditions to be detected with increase and as and allows cancerous conditions to be detected with increase and as and allows cancerous conditions to be detected with increase and as and as a constitute.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Peptide nucleic acid; PNA; telomerase; ribonucleoprotein enzyme; cancer; inhibitor; neoplasia; neurodegenerative disease; aging; hyperplasia; AIDS; HIV; fungal infection; forensic identification; detect; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             possibly at an earlier stage, before cells are detected as cancerous based on pathological characteristics. The diagnostic and prognostic methods of the present invention can be used to detect an immortal or neoplastic cell or tumour tissue or cancer of any oxigin, provided the cell expresses telomerase activity and its RNA component
                                                                    The present sequence represents a peptide nucleic acid molecule which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /*tag= a

The present sequence represents an antisense oligonucleotide used as a control sequence alongside a peptide nucleic acid molecule which control sequence alongside a peptide nucleic acid molecule which control sequence alongside a peptide nucleic acid molecule which telomerase is a ribonucleoprotein enzyme that telomerase activity. Telomerase is a ribonucleoprotein enzyme that telomerase activity. Telomerase is a ribonucleoprotein enzyme that controlled the sequence contained within the RNA component of the enzyme. The invention relates to PNA molecules having a sequence of no more than 25 bases, which include the sequence GTTAGG. The uncharged nature of the PNA backbone increases the melting temperature of associating strands, increases the melting temperature of associating strands, increases the melting temperature of associating such as as concers, nooplasia, hyperplasia, neurodegenerative diseases or nucleases. The conclusion in an associated pathologies, fungal infections and other cycoxic or syndrome) and associated pathologies, fungal infections, and other conclusions, and other cycoxic or cytostatic agents, antifungal agents, and other nucleotise. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization probes to detect or quantitate polymucleotides having a human telomerase of individuals, e.g. paternity testing, based on hTR gene restriction of individuals, e.g. paternity testing, based on hTR gene restriction inhibitors of telomerase activity. The method of the present invention allows cancerous conditions to be detected with increased confidence and possibly at an earlier stage, before cells are detected as cancerous conditions to be detected with increased confidence and possibly at an earlier stage, before cells are detected as cancerous conditions to be detected and pathological characteristics. The diagnostic and propose to detect of control can be used as and sample and as a manally and the present invention allowers. The methods of the present invention are nearly an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide nucleic acid; PNA; telomerase; ribonucleoprotein enzyme; cancer; inhibitor; neoplasia; neurodegenerative disease; aging; hyperplasia; AIDS; HIV; fungal infection; forensic identification; detect; tumour; paternity testing; ss.

The present sequence to the many component of manmalian telomerase, and inhibits telomerase activity. Telomerase is a ribonucleoprotein enzyme that telomerase activity. Telomerase is a ribonucleoprotein enzyme that telomerase spatials as a template an 11 nucleotide sequence contained within the RNA component of the enzyme. The nucleotide sequence contained within the RNA component of the enzyme. The invention relates to PNA molecules having a sequence of no more than 25 bases, which include the sequence GTTAGG. The uncharged nature of the PNA backbone increases the melting temperature of associating strands, carfords greater resistance of degradation by proceases or nucleases. The therapeutic PNAs may be used for treating disease or nucleases. The therapeutic PNAs may be used for treating disease or nucleases. The cancers, neoplasia, hyperplasia, neurodegenerative diseases, aging, human confinction virus (HIV) infection/AIDS (acquired immunodeficiency syndrome) and associated pathologies, fungal infections, and other cytostatic agents, antifungal agents and other cytostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization cytostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization of individuals, e.g. paternity testing, based on hTR gene restriction fragment length polymorphism (RPLP) pattern. PNAs are also useful as probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention continual conterns conditions to be detected with increase and as allows cancerous conditions to be detected with increase and as allows cancerous conditions to be detected with increase and as allows cancerous conditions to be detected with increase and as allows cancerous conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        wew peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a mammalian telomerase.
                                                                                             /note= "Peptide nucleic acid molecule, where N-(2-aminoethyl)glycine units are linked to nucleotide bases via glycine amino N through a methylenecarbonyl linker"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               possibly at an earlier stage, before cells are detected as cancerous based on pathological characteristics. The diagnostic and prognostic methods of the present invention can be used to detect an immortal or neoplastic cell or tumour tissue or cancer of any origin, provided the cell expresses telomerase activity and its RNA component
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    present sequence represents a peptide nucleic acid molecule which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Corey DR

New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a mammalian telomerase.

Claim 6; Col 71; 45pp; English.

The present sequence represents a peptide nucleic acid molecule which the present sequence represents a peptide nucleic acid molecule which component of mammalian telomerase, and inhibits telomerase activity. Telomerase is a ribonucleoprotein enzyme that stelomerase activity. Telomerase is a ribonucleoprotein enzyme that stelomerase activity. Telomerase is a ribonucleoprotein enzyme that component of the enzyme. The invention relates to PNA molecules having a sequence of no more than 25 hases, which include the sequence GTTAGG. The uncharged nature of the PNA backbon increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. The therapeutic PNAS may be used for treating diseases or nucleases. The therapeutic PNAS may be used for treating diseases or nucleases. The therapeutic PNAS may be used for treating diseases or nucleases. The immunodeficiency virus (HIV) infection/AIDS (acquired diseases, adjng, human immunodeficiency virus (HIV) infection/AIDS (acquired immunodeficiency sydrome) and associated pathologies, fungal infections, and other cytotoxic or cytostatic agents, antitungal agents, and other nucleotides. PNAS may be used for molecular diagnostics, labelled PNAs are used as hybridization brobes to detect or quantitate polynucleotides having a human telomerase RNA (HTR) sequence. PNA probes are also used for forensic identification of individuals, e.g. paternity testing, based on hTR gene restriction fragment length polymorphism (RFLP) pattern. PNAs are also useful as chooses to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention can be used to detected as cancerous based on pathological characteristics. The diagnostic and proposition cell expresses telomerase activity. The method of enceted and immortal or neoplastic cell or temorase doring the present invention cell expresses telomerase activi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian telomerase. The PNAs are useful as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polymucleotide having the human telomerase RNA component (hTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal suspects or unknown descendants based on the hTR gene RFLP pattern. The PNA can be further used for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenetative diseases. The PNAs in combination with other pharmaceuticals (such as antineoplastic or cytostatic agents) can be used for treating neoplasia,
                                                                                                                                                                                                                                                                                                                                                                                  /*tag= a

The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian cells by hybridising to the RNA component of mammalian cells by hybridising to the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polynucleotide having the human telomerase RNA component (hTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal suspects or unknown descendants based on the hTR gene RFLP pattern. The PNA can be further used for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmaceuticals (such as antinooplastic or cytostatic agents) can be used for treating neoplasts, hyperplasia, human immunodeficiency virus (HIV) infections, acquired
                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        comprising
                                                                                                   activity. The present sequence represents one of the PNA sequences of the
hyperplasia, human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomere metabolism or telomerase
                                                                                                                                                                                                                                                                                                                                  Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New peptide nucleic acids that hybridizes to the RNA component of mammalian telomerase, useful for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  hTR gene RFLP pattern; cancer; inflammation; forensic; lymphoproliferative disease; autoimmune disease; hyperplasia; lymphoproliferative disease; neoplasia; HIV; AIDS; cytostatic; human immunodeficiency virus; acquired immunodeficiency syndrome; telomere metabolism; anti-inflammatory; immunosuppressive; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian telomerase. The PNAs are useful as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polynucleotide having the human telomerase RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                   /*tag= a

component (hTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal suspects or unknown descendants based on the hTR gene RPLP pattern. The PNA can be further used for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmaceuticals (such as antineoplastic or cytostatic agents) can be used for treating neoplasia, hyperplasia, human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (ALIDS) and associated pathologies, and other diseases characterised by abnormal telemere metabolism or telemerase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mammalian; forensic; paternity testing; human telomerase RNA component; hTR gene RFLP pattern; cancer; inflammation; lymphoproliferative diseas autoimmune disease; neurodegenerative disease; neoplasia; hyperplasia; HIV; AlDS; human immunodeficiency virus; telomere metabolism; mutant; acquired immunodeficiency syndrome; cytostatic; anti-inflammatory; immunosuppressive; phosphorothioate; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian telomerase. The PMAs are useful as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to
                                                                                 detect and/or quantitate polymicleotide having the human telomerase RNA component (HTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal suspects or unknown descendants based on the hTR gene RFLP pattern. The PNA can be further used for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmaceuticals (such as antinoplastic or cytostatic agents) can be used for treating neoplasis hyperplasia, human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomere metabolism or telomerase activity. The present sequence represents a phosphorothioate (PS) oligomer used to inhibit telomerase activity in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polynucleotide useful for inhibiting telomerase activity in cells, of for treating telomerase-mediated condition or disease, such as cancers, tumors, Hodgkin's disease, or inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; telomerase; hTR; cytostatic; anti-inflammatory; adenocarcinoma;

The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase posttive cell, and in manufacturing a medicament for inhibiting telomerase activity in a call manufacturing a medicament for inhibiting telomerase activity in a cell and in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukaemia, Hodgkin's disease, fertility and inflammatory conditions. (I) are also useful in treating a tumour or in manufacturing a medicament for the treatment of tumour. The polynucleotide inhibitors may also be used in diagnostic assays for detecting RNA or DNA. Inhibition of telomerase contivity in cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative continuation of telomerase in haematopoietic stem cells is useful for immunosuppression and for selectively down-regulating specific continuation system. The present sequence represents human telomerase polynucleotide inhibitor #8, as described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polynucleotide useful for inhibiting telomerase activity in cells, or for treating telomerase-mediated condition or disease, such as cancers, tumors, Hodgkin's disease, or inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; telomerase; hTR; cytostatic; anti-inflammatory; adenocarcinoma;

The invention relates to polymucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a cell can in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukaemia, CK Gadenocarcinoma of breast, prostate or colon, mixed cell leukaemia, CK Hodgkin's disease, fertility and inflammatory conditions. (I) are also useful in treating a tumour or in manufacturing a medicament for the ctreatment of tumour. The polymucleotide inhibitors may also be used in catement of tumour or in useful in prophylactic and therapeutic activity in cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative configences in thibition of telomerase in haematopoletic stem cells is useful for immunosuppression and for selectively down-regulating specific branches of the immune system. The present sequence represents human the immense plynucleotide inhibitor #12, as described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

The invention relates to polymucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a cell and in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukaemia. (Consection of disease, fertility and inflammatory conditions. (I) are also treatment of tumourr or in manufacturing a medicament for the treatment of tumourr or in manufacturing a medicament for the creatment of tumourr. The polymucleotide inhibitions and therapeutic diagnostic assays for detecting RNA or DNA. Inhibition of telomerase cation disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative capression of telomerase, and in treating veterinary proliferative for immunosuppression and for selectively down-regulating specific branches of the immune system. The present sequence represents human the inversion that in the present sequence represents human the inversion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      note= "2',4'-oxyethylene linkage in the sugar residues"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                        The present invention relates to novel 2',5'-oligoadenylic acid analogs and their pharmacologically- acceptable salts. The analogs are stable with superior antitumour and antiviral activity and so are useful in cancer or antiviral therapy e.g. as antisense drugs. The present sequence

                                                                 The present invention relates to novel 2',5'-oligoadenylic acid analogs and their pharmacologically- acceptable salts. The analogs are stable with superior antitumour and antiviral activity and so are useful in cancer or antiviral therapy eg. as antisense drugs. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2 Primers (see AAV27886 and AAV27887) are used in the PCR amplification of a 520 bp fragment of telomerase genomic DNA from HeLa cells. The PCR product was used to prepare 2 DNA constructs, each containing the T7 product was used to prepare 2 DNA constructs, each contained by which would generate sense strand human telomerase RNA in a transcription reaction. The other construct (for primers see AAV27889-89) contained DNA which would generate antisense strand human telomerase RNA in a transcription reaction. The human telomerase RNA was used for in vitro assays to demonstrate that wild-type TP2 and sense telomerase RNA are required for telomerase activity, Novel TP2 can be used to develop products that regulate telomerase activity, useful e.g. for treating cancer, AIDS and ageing disorders.                                                                              ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an antisense compound targeted to a nucleic acid molecule encoding acyl-coenzyme A synthetase 1 (ACSI). The antisense compound specifically hybridises with and inhibits the expression of ACSI. The antisense oligonucleotides or compounds are useful for inhibiting the expression of acyl-coenzyme A synthetase 1 (ACSI), and for treating diseases or conditions associated with aberrant expression of ACSI, e.g. diabetes, obesity, metabolic syndrome X, cardiovascular reagents are or cancer. The antisense compounds are also useful as research reagents and kits, or in diagnostic, therapeutic and prophylactic applications, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents an acyl-coenzyme A synthetase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compounds targeted to nucleic acid molecules encoding acyl-
coenzyme A synthetase 1 (ACSI), useful for treating diseases or
conditions associated with aberrant expression of ACSI, e.g. diabetes,

The invention relates to an antisense compound targeted to a nucleic acid molecule encoding acyl-coenzyme A synthetase 1 (ACS1). The antisense compound specifically hybridises with and inhibits the expression of ACS1. The antisense oligonucleotides or compounds are useful for inhibiting the expression of acyl-coenzyme A synthetase 1 (ACS1), and for treating diseases or conditions associated with aberrant expression of ACS1, e.g. diabetes, obesity, metabolic syndrome X, cardiovascular disorder or cancer. The antisense compounds are also useful as research reagents and kits, or in diagnostic, therapeutic and prophylactic applications, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents an acyl-coenzyme A synthetase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compounds targeted to nucleic acid molecules encoding acyl-coenzyme A synthetase 1 (ACS1), useful for treating diseases or conditions associated with aberrant expression of ACS1, e.g. diabetes,

                                                                                                                                                                                                                                                                                                                                   The invention relates to cold-adapted influenza viruses prepared by passage culture of A/X-31, B/Yamagata/16/88 or B/Leo/40 viruses at low temperatures. A cDNA gene of cold-adapted influenza virus HTCA-A101 can be selected from a group consisting of PB2 protein gene, PB1 protein gene, RAPR2122-X82197). The method is useful for the production of coldadapted influenza virus that exhibit temperature sensitivity and can be actively grown in fertilized eggs. The virus is useful for vaccines for protection against fil. Live vaccines containing cold-adapted viruses have several advantages over killed vaccines. It can prevent reduction of immunogenicity, which may occur in the killed vaccine where antigenic protecins will be denatured at its inactivation. It can also avoid typersensitivity due to the prolonged administration of heterologous proteins. It promotes the immunity by inducing IgA and it can be administrated into a spray formulation via nasal cavity and thus its administration is convenient for children. It able to inhibit the growth of the wild-type virus and thus its therapeutic effect can be expected. Sequences AXX8222-X82257 represent PCR primers specific for the various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

This invention describes a novel rapid and sensitive method for detecting Histoplasma capsulatum. The method uses oligonuclectide primers which amplify a segment of DNA specific to the H. capsulatum 5.85 rRNA gene. The method of the invention can be used to detect H. capsulatum in a wide variety of samples. For example, for public health protection convironmental samples containing soil, vegetation, dust, decaying faeces from birds and bats, etc. can be assayed for the presence of the canalysed e.g. those who are suspected of having contracted fresh histoplasmosis as a result of symptomology, and immune compromised individuals who may be at risk of contracting ofhonic pulmonary or ocular chaptasmosis. The prior arisk of contracting ofhonic pulmonary or ocular chaptasmosis. The prior arisk of contracting ofhonic pulmonary or capsulatum is expensive and requires several weeks to complete. The capsulatum is expensive and requires several weeks to complete. The capsulatum is expensive and requires several weeks complete. The capsulatum. The present invention provides this needs as it is rapid, sensitive and inexpensive. This sequence represents PCR primer HCI which is used in the method of detection. (Updated on 15-SEP-2003 to

                                                                                                                                                                                                                            8
                                                                                                   The polynucleotide contains the partial base sequence of the Japanese type C hepatitis virus (HCV) gene. The DNA was obtd. from the serum of a non A non B hepatitis patient. The serum was ultracentrifuged and the ppte. dissolved in a mixture of GITC, Na citrate, sarcosine and mercaptoethanol. Phenol chloroform was added and the mixture centrifuged. Isopropanol was added to the aq. layer which was left to stand at -20 deg C for 3 hrs, then centrifuged. The ppte. was treated by GITC and phenolchloroform and pptd. By ethanol and dissolved in dR2O to give an aq. DNA soln. The gene was sequence A genomic version of the sequence was given (AAQ23036). In the version shown there is a Y at base 189. The DNA in the specification has a guanine at this position. The DNA may be used as a probe for detection of Japanese type C hepatitis. Antisense compounds of the invention are useful for treating an animal having a disease or condition associated with Jagged 2 e.g. hyperproliferative disorder (particularly cancer), a developmental disorder or a disease or condition that arises from aberrant apoptosis. They are also used for diagnostics, prophylaxis or as research reagents or kits. The invention is also useful in antisense therapy. The present sequence is human Jagged 2 DNA specific PCR primer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antisense, Jagged 2; hyperproliferative disorder; cancer; developmental disorder; apoptosis; prophylaxis; antisense therapy; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotides for modulating Jagged 2 expression, useful for diagnosing, preventing or treating diseases or conditions associated
                    treating a subject having a disease or condition associated with insufficient apoptosis by administration of a Jagged 2 inhibitor; (2) a pharmaceutical composition comprising a Jagged 2 inhibitor and another active ingredient for inducing apoptosis; and (3) a kit comprising a Jagged 2 inhibitor and instructions for using the Jagged 2 inhibitor in the induction of apoptosis. The Jagged 2 inhibitor has cytostatic activity. The method can be used for inducing apoptosis in a call or animal for treating a subject having a disease or condition associated with insufficient apoptosis, e.g., hyperproliferative disorder. The present sequence represents a PCR primer for human Jagged 2, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
inhibitor to reduce Jagged 2 levels or activity. Also described: (1)

This invention relates to novel antisense compounds that can be used to modulate the expression of Jagged 2. Specifically, it refers to compositions useful for inhibiting the expression of Jagged 2, a human homologue of the Drosophila Scrate gene, which is involved in differentiation and cell fate, as well as positive feedback control over signalling genes such as Notch 1, Notch 3 and Jagged 1. The Jagged 2 gene is located on chromosome 14932, a region that has been implicated in genetic diseases including Usher syndrome type la that is associated with cetinitis pigmentosa. The present invention describes antisense oligonucleotides that comprise at least one modified sugar moiety, a 2'-O methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-C methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-C methylcytosine. These compounds are useful for modulating the mucleic acid molecules encoding Jagged 2, ultimately modulating the amount of Jagged 2 produced, which in turn is useful for research

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 29; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NRKB), where I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulatings REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A.

(I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, espocially Mg 2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer. malanoma, lymphoma, glioma or multidurg resistant cancer antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, edatrexate, genetitable or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as calle useful for treating inflammatory disease such as calle useful for treating inflammatory disease, diabetes, obesity, autoimmune disease, lupus, multiple solerosis, transplant/graft rejection, gene therapy applications, ischemialreperfusion injury (central nervous system (CNS) and molecules of a novel enzymatic en ensymatic central nervous system (GNS) and molecules of a novel enzymatic.

infection. This sequence represents the substrate of a novel enzymatic

                                                                                                                                                                                                                                                                                                                                                                                                                     ઠ
                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NRKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A.

(I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg<sup>2</sup>2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemocherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, gencitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as theumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lughs, multiple sclarosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, espsis, allergic alrway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is an antisense oligonucleotide which was used in an RNase mapping experiment. This enables the identification of sites within the Ii RNA strand which hybridise to antisense DNA. These sites can then be used as targets for antisense strands which may, using gene therapy, be used as tumour cell vaccines (for example to treat carcinomas, paranoman, laukaemia, lymphomas, stomach, breast, colon or rectum, lung, prostate, bladder, pancreas, brain and ovarian cancers), or they can be used to treat autoimmune diseases including rheumatoid arthritis,

The invention also relates to novel fusion proteins comprising an immunoglobulin (19) molety fused to a non-immunoglobulin molety comprises a first domain from a first antibody isotype and a second domain from a second antibody isotype. The antibodies or 1g fusion proteins are useful to produce intext antibodies, immunocytokines, immunofusions, immunoligands and other antibody and Fc fusion proteins that enhance the expression, proper oligomerisation, purification and protease resistance of desired fusion proteins, optionally with modified, combined or decreased Fc effector functions. The present sequence is a PCR primer which is used to construct human KSgamma2h antibody expression vector. This sequence is used in the exemplification of the invention
                                                                                                                                                           Immunoglobulin; Ig; antibody; immunocytokine; immunofusion; immunoligand;
protease resistance; PCR; primer; ss.

The present invention relates to detecting and identifying fungal pathogenic species in a sample. The method involves hybridizing a nucleic acid of a fungal pathogen possibly present in the sample with at least one oligonucleotide probe, from an Internal Transcribed Spacer (ITS) region. The method is useful for simultaneous detection and differentiation of clinically important fungi in a single assay, Cartuelly indicatent fungi in a single assay. Cartuell, C. glabrata, C. parapsilosis, C. tropicalis, C. ketyr, versicole, A. nidulans, A. funigatus, C. neoformans and pneumocystis carinii. The method is especially useful in the detection of opportunistic infections in patients with impaired immunity systems, such as organ transplants patients, patients receiving intensive anticancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The patent discloses new macromolecules of formula PNA-DNA-PNA, in which DNA comprises at least one 2'-deoxynucleotide and each PNA comprises at least one peptide nucleic acid subunit. These compounds have increased resistance to nuclease and increased specific binding affinity, and they can activate RNaseH for target strand cleavage. They can hybridise specifically to a nucleic acid strand (especially RNA) and are useful (1) for treating diseases associated with undesirable production of protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New chimeric macromolecules contg. DNA and peptide nucleic acid segments - with good nuclease stability and binding affinity, also activating RNaseH, useful for treating disease, in diagnosis and for identifying
Cryptococcus and Aspergillus, comprises hybridizing the amplified nucleacid of the fungal pathogen with a probe from the internal transcribed spacer region of a DNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of identifying a modulator of Cdc25 activity that comprises contacting a test cell having a recombinant Cdc25 phosphatase gene whose expression alters transcription of a selected gene, with a compound under conditions where recombinant Cdc25 phosphatase gene is expressed and alters the transcription of a selected gene as an indication of the compound being a modulator of Cdc25-mediated transcription. The method is useful for identifying modulators of Cdc25
                                                                                                                                                                                                                                                             Assay for screening modulators of Cdc25 activity by using a cell having recombinant Cdc25 phosphatase gene whose expression alters the transcription of a selected gene in the presence of a modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    activity. Sequences AAF57363-376 represent intron/exon splice junction sequences of the murine Cdc25A gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Van Der Weide M;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an enzymatic nucleic acid molecule (I) with RNA cleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDN sequence encoding maize Delta-9 desaturase. (I) can be used to modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canola plant). (I) can be used to modulate caffeine synthesis in a coffee plant, nicotine production in a tobacco plant, fruit ripening processes in an apple, tomato, pear, plum or peach plant, flower pigmentation in a rose, petunia, chrysanthemum or marigold plant or lignin production in a tobacco, aspen, poplar or pine

GRID is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of GRID, to treat conditions such as tissue/graft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemotherapy and cyclosporin treatment. The present oligonucleotide was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid(s) for regulating the Grb2-related with Insert Domain (GRID) gene comprises using antisense and enzymatic nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                           Human, Grb2-related with Insert Domain, GRID, T-cell;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to oligonucleotides that downregulate the expression of human Grb2-related with Insert Domain (GRID) gene. GRID is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of GRID, to treat conditions such as tissue/graft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemotherapy and cyclosporin treatment. The present oligonucleotide was used to illustrate the invention

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphome, Ewing's sarcoma, metanoma, conditions selected from cancer, lymphome, Ewing's sarcoma, metanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, verruca vulgaris, angiofibroma of tuberous sclerosis, port wine stains, Sturge Neber syndrome, Rippel Trenaunay-Meber syndrome, Oaler-Weber-rendu Syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cellseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically transcring molecules which regulate expression of ERG fusion genes. ABX 1354-ABX2719 represent nucleic acids, including antisense and enzymetic nucleic acids molecules which regulate expression of ERG, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                     proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is proteins and their coding sequences: MD24, MD24, MD27, MD212. MD23. MD212. MD21 is encoded at chromosome fg21.1, MD24 is encoded at chromosome fg21.3-22.2, MD24. MD23, MD24, MD27, and MD212 sequences are useful in therapy. Or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD27, or MD212 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymetic nucleic acid; hammer/head ribozyme; DNAzyme; inozyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state, HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                        New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                           The present invention relates to novel human zinc finger-containing

the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, Indxymes, indxymes, and G-claever ribozymes, DNAzymes, or nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and complete the expression and/or replication of HCV. The compounds and disease states related to HBV and HCV infection, replication and gene cates related to HBV and HCV infection, replication and gene active acids and complete the expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represente a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid molecule, Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis, antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptemer; HBV reverse transcriptase; Enhancer I region; viral replication;

Murine oligonucleotide associated with tumour supression, SEQ ID 5862.

01-JUL-2003 (first entry)

ACC68615;

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, anderzymes, and have viral replication, Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocallular expression such as cirrhosis, liver failure, and hepatocallular expression and NNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus

and transfected cells.

```
The present invention relates to murine oligonucleotides (ACC62754-ACC68006), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying uncleic acid, e.g. as one component of a gene chip; in vitro as (anti) eense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenosis; asthma; Crohn's disease; diabbtes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
IKappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
lymphoma or glioma), inflammatory disease (e.g. rheumatoid archritis,
restenosis or asthma), inflammatory disease (e.g. rheumatoid archritis,
cestenosis or asthma), crohn's disease, diabetes, obesity, autoimmune
ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
cexpression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human NOGO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                               Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection;

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (FTGDR),
IKappa Kinase (IKK), or protein Kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
disease, lugus, multiple sclerosis, transplant/graft rejection,
cischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
cxpression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of
target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; prostaglandin D2 recebrovascular accident; central kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenoisis; asthma; Crohn's disease; diabbtes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    χ.

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
IRappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: creebrovascular accident, central
nervous system (CKS) injury, spinal cord injury, cancer (e.g. melanoma,
Impubna or glioma), inflammatory disease (e.g. rheumatoid arthritis,
restenosis or asthma), Crohn's disease, disease, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
carget session of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human IKK-
gamma substrate sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PrGDR),
KappaB kinase (IKK), or protein kinase PrR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
restenosis or asthma), inflammatory disease, diabetes, obesity, autoimmune
classes, lupus, multiple sclerosis, transplant/graft rejection,
ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermattis). The
nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of
carget evaluations within diseased cells or to detect the presence of
carget evaluations within diseased cells or to detect the presence of
carget evaluations within diseased cells or to detect the presence of
carget evaluations within diseased cells or to detect the presence of
carget evaluations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                The invention relates to a nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, e.g. a hammerhead ribozyme, NCH ribozyme, G-cleaver ribozyme, Zinzyme, DNAzyme, amberzyme, Inozyme or hairpin ribozyme. Also include are a mammalian cell including the novel nucleic acid molecule, reducing GRID activity in a cell by contacting the cell with the novel nucleic acid molecule, treating a patient having a condition associated with the level of GRID creating a patient having a condition associated with the level of GRID cell or treating a patient having a condition associated with the level of GRID contacting the cell with the novel nucleic acid molecule, cleaving RNA of a GRID gene by contacting the cell with the novel nucleic acid molecule in ammaner that allows its expression vector comprising a nucleic acid sequences (encoding at least the novel nucleic acid molecule in ammaner that allows its expression), a mammalian cell including the expression vector and an enzymatic nucleic acid molecule is useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is a target region for the enzymatic nucleic acide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                              New nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and

The invention relates to a nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, e.g. a hammerhead ribozyme, NCH ribozyme, G-cleaver ribozyme, Zinzywe, DNAzyme, C amberzyme, Inozyme or hairpin ribozyme. Also include are a mammalian cell molecule including the novel nucleic acid molecule, reducing GRID activity in a cell by contacting the cell with the novel nucleic acid molecule, treating a patient having a condition associated with the level of GRID c treating a patient having a condition associated with the level of GRID c contacting the cell with the novel nucleic acid molecule, cleaving RNA of a GRID gene by contacting the cell with the novel nucleic acid molecule, an expression vector comprising a nucleic acid sequences (encoding at less the novel nucleic acid molecule in a manner that allows its expression), a mammalian cell including the expression vector and an enzymatic nucleic coid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule is useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is a target region for the enzymatic nucleic acide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaрв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         enzymatic nucleic acid; RNA cleavage; hepatitis C virus; HCV; infection; type I interferon; DNAzyme.

                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                   Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Maize, corn, Zea mays, delta-9 desaturase, GBSS, target, substrate, granule bound starch synthase; hammerhead ribozyme, hairpin ribozyme, modulation; gene expression, transgenic plant; cleavage; canola plant; caffeine synthesis; coffee plant; nicotine production; tobacco; fruit ripening; flower pigmentation; lignin production; ss.

maize or canola.

```
The present invention describes an enzymatic nucleic acid molecule (I) with RNA cleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDNA sequence encoding maize Delta-9 desaturase. (I) can be used to modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canola plant). (I) can be used to modulate caffeine synthesis in a coffee plant, nicotine production in a tobacco plant, fruit ripening processes in an apple, tomato, pear, plum or peach plant, flower pigmentation in a rose, petunia, chrysanthemum or marigold plant or lignin production in a tobacco, aspen, poplar or pine
                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This exon specific primer used in the PCR amplification of a short stature associated sequence. The gene region corresponding to short stature has been identified as a region of approximately 500 kb in the PARI region of the X and Y chromosomes. There genes in this region have been identified as candidates for the short stature gene. These genes were designated SHOX (also referred to as SHOX93 or HOX93), pET92 and SHOX (slox-like homeobox gene on chromosome three). The SHOX gene has two separate splicing sites resulting in two variations SHOXa and SHOXb. The specification provides sequences of SHOX (short stature homeobox-containing) genes SHOX ET92, SHOXb, SHOT and exons of the SHOX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Homeobox domain; human growth gene; growth regulation; growth defect; turner's syndrome; short stature homeobox containing gene; short stature; SHOX; bone disease; osteoporosis; calcium regulation; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human growth genes - used to develop products for the diagnosis and treatment of human growth defects such as short stature, e.g. Turner's
                                                                                                                                                                                                                                                                                                                                                    Gaps

The probe comprises a base sequence that is complementary to the target nucleic acid and has at least one artificial mismatch and at least one original mismatch with respect to the target nucleic acid, where the artificial mismatch and original mismatch and effect in different base positions. The probe of the invention may be useful for detecting genetic variation by gene amplification, mutation-specific DNA sequencing or a mutation-specific DNA thip, preferably for detecting a polymorphism in exon 2 of HIA-DRB1. The current sequence is that of a probe of the invention which was used to detect a polymorphism in human HLA-DRB1 exon 2 DNA.
genes as shown in AAV35610 to AAV35621 and protein sequences of the human growth protein transcription factor SHOXa, SHOXb and SHOT as shown AAW60573. The novel genes are responsible for human growth. Defects in the genes acan cause short stature, e.g. Turner's syndrome. The products can be used to develop agents for the treatment of short stature providing a mitogenic effect on cells, e.g. for the treatment of bone diseases such as osteoporosis and diseases involved with disturbance in the bone calcium regulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel probe for detecting gene polymorphism, contains oligonucleotide which is complementary to target sequence, has artificial mismatch with respect to target, and has original mismatch with respect to allelic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

This invention relates to a novel chemical sensor system method. Specifically, it refers to an isolated nucleic acid molecule that encodes a receptor protein, which binds to chemicals that can stimulate the sense of taste or smell for example. The present invention describes the manufacture of a chip that acts as support to immobilise transfected calls expressing the receptor gene, such that this chip can be employed as a component of the chemical sensor model. Furthermore, this chip is useable as an artificial sensory organ where the chemical receptor occurains an olfactory receptor the sensor can react to olfactory stimulation. Accordingly, these sensors are useful in the food industry for analysing freshness of meat, fruit and vegetables, hygiene simple city manufaction, environmental examination and disease diagnosis. Purthermore, such systems are automatable for high throughput applications under various conditions, even for differentiating optical isomers of R(:)-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chemical sensor systems based on chemical receptors introduced into cells for immobilization onto support to form chip as component of sensor, useful in detecting stimuli e.g. taste and smell applicable in food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 carvone from S(+)-carvone easily. This oligonucleotide sequence is used to construct an odourant receptor DNA expression vector of the invention
                                                                                                                                                                                                                                             DNA oligo to construct an odourant receptor expression vector SegID102.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gapв

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The INVELLOR interacts to promoter regions from micros and indicated to a cancer, especially a gene encoding a cytotoxin, for therapy of the terologous gene, especially a gene encoding a cytotoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of telomerase repression pathway may cause reactivation or upregulation of telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (especially pGT62-codAupp) comprising the promoter and a viral thymidine kinase gene can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the HTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AAZ07696-3121 represent PCR primers used in cloning and mutagenists of human TR gene (HTR) promoter region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to promoter regions from mouse and human telomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mouse and human telomerase RNA gene promoters, useful for tumor specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention relates to oligonucleotides that downregulate the expression of human GrD2-related with Insert Domain (GRID) gene. GRID is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of GRID, to treat conditions such as its sucygraft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemotherapy and cyclosporin treatment. The present oligonucleotide was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                   The present invention relates to oligonucleotides that downregulate the expression of human Grb2-related with Insert Domain (GRID) gene. GRID is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of GRID, to treat conditions such as tissue/graft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemotherapy and cyclosporin treatment. The present oligonucleotide was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel polynucleotide which down regulates expression of Ets-related gene,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             neovascular glaucoma, myopic degeneration, arthritis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stain, wound healing; Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, leukaemia, 88;
                                                                                                 New nucleic acid(s) for regulating the Grb2-related with Insert Domain (GRID) gene comprises using antisense and enzymatic nucleic acid molecules such as hammerhead ribozymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ophthalmological, antiarthritic, antipsoriatic, virucide, osteopathic, vulnerary, cancer, lymphoma; Ewing's sarcoma; melanoma; psoriasis; tumour angiogenesis; diabetic retinopathy; macular degeneration;

conditions elected from cancer, lymphoma, Ewing's sarcoma, melanoma, conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, cumour angiogeneration, archiritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge correcting a patient having a condition associated with the level of ERG, treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour conditions suitable for the treatment. Leukaemia or tumour conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a conjunction such as Mg2+. (I) is useful for dispensed of contitions and diseases related to the expression of ERG, and as diagnostic tool to cation such as Mg2+. (I) is useful for specifically cation genes that share homology with ERG gene or ERG fusion genes. Constructing within diseased or ERG fusion genes. Constructing such as a cell. (I) is useful for specifically cation such as Mg2+. (I) is useful for specifically contacting genes that share homology with ERG gene or ERG fusion genes. Constructing such as mandament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                           The invention comprises the identification of genetic polymorphisms in the human cytochrome P4502A6 (CYP4502A6 or CYP2A6) gene. The human cytochrome P4502A6 gene is located on chromosome 19 and encodes an enzyme that plays a role in the metabolism of steroids, the detoxification of drugs and xenobiotics, and the activation of procarcinogens. The P4502A6 polymorphisms identified in the invention are useful for evaluating an individual's risk of developing asthma or an individual's propensity for cigarette consumption. The P4502A6 DNA sequences of the invention are useful for identifying individuals having a polymorphic genotype and to screen individuals for altered metabolism for cyclothrome P4502A6 substrates. The P4502A6 DNA sequences of the invention are also useful for identifying individuals who are at risk from inflammation, asthma, habitual smoking and diseases that result from environmental or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; ds; single nucleotide polymorphism; SNP; cytochrome; P4502A6; CYP4502A6; CYP2A6; chromosome 19; steroid metabolism; drug detoxification; xenobiotic detoxification; procarcinogen activation;
                                                                                                                                                                                                                                                                                  occupational exposures to dangerous substances. The present DNA sequence represents a polymorphic region of the promoter for the human cytochrome P4502A6 gene
                                                        New isolated polynucleotide, useful to screen individuals for asthma, inflammation and susceptibility to habitual smoking, comprises base variation from that of known human cytochrome P4502A6 sequence.
                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human cytochrome P4502A6 (CYP4502A6) promoter - polymorphic region 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /standard_name= "Single nucleotide polymorphism"

                                                                                                                                                                                                                                                                                                         The invention comprises the identification of genetic polymorphisms in the human cytochrome P4502A6 (CYP4502A6 or CYP2A6) gene. The human cytochrome P4502A6 (CYP4502A6 or CYP2A6) gene. The human cytochrome P4502A6 gene is located on chromosome 19 and encodes an enzyme that plays a role in the metabolism of steroids, the detoxification of drugs and xenobiotics, and the activation of procarcinogens. The P4502A6 polymorphisms identified in the invention are useful for evaluating an individual's propensity for cigarette consumption. The P4502A6 DNA sequences of the invention are useful for identifying individuals having a polymorphic genotype and to screen individuals for altered metabolism for cytochrome P4502A6 substrates. The P4502A6 DNA sequences of the invention are also useful for identifying individuals who are at risk from inflammation, asthma, habitual smoking and diseases that result from environmental or habitual successions.

                                                                                                                                                                                                                       The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFRS), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG-2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophagel, stoomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouzacil carboplatin, edatrexate, cyclophosphamide or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as theumatoid arthritis, restenosis, asthma. Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, asthma. Central nervous system (CNS) and myocardial), glomerulonephritis, especial are allergic airway inflammation, inflammatory bowel disease or configuration and antisemed or configuration and ant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                              Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

```
The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule acid molecule, that modulates human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV acid molecules are useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ6520 - ABZ65224, ABZ65530 - ABZ65216, Human
                                                                                                                                                                                                                                                                                                                                            Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding

                                                                 The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-theumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are blacker, or pancreatic cancer, and HIV infection, and AIDS. The sequences bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ56858 represent substrate/target sequences for the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead riboxyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative, disease state, HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes. DNAzymes, concerning are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV CO DNA. The nucleic acids may be used to modulate the expression of HBV CO DNA. The modulate the expression Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and compounds of disease states related to HBV and HCV infection, replication and gene concession such as cirrhosis, liver failure, and hepatocallular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                              Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid molecule, Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptemer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 13.4; DB 1; Length 17; Pred. No. 3.6e+02;

                                                                                                                                                                                                                                                                                                                                      The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HVV) or Hepatitis B virus (HVV) or Apatitis B virus (HVV) or an oncleic acide and an entisense and enzymatic nucleic acids such as hammerhead ribozymes. DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are and eacy molecules and aptamers that bind to HBV reverse transcriptase primar sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and/or potential theraples directed against HBV, and compounds compounds and/or potential theraples directed against HBV, and compounds compounds of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene compounds and the compounds and HCV infection, replication and gene configuration and gene acids may be accounted and the procession and specific acids and repatication and gene acids may be accounted and seasons and acids acids and acids and acids acids and acids acids and acids and acids and acids acids acids and acids acids acids acids and acids acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

This invention relates to novel isolated nucleic acid sequences involved in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, notropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or complication for example as one component of a gene chip, in viro as antisense reagents and for production of recombinant of polypeptides. The invention may therefore be useful for preparation of polypeptides. The invention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention.

Once: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                          New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, 88, GRID, Grb2-related with insert domain, hammerhead ribozyme,

```
The invention relates to a nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, e.g. a harmerhead ribozyme, NCH ribozyme, G-cleaver ribozyme, Zinzyme, DNAzyme, anderhead ribozyme, NCH ribozyme, Also include are a mammalian cell including the novel nucleic acid molecule, reducing GRID activity in a cell by contacting the cell with the novel nucleic acid molecule, treating a patient having a condition associated with the level of GRID (e.g. tissue/graft rejection or leukaemia) by contacting the cell with the novel nucleic acid molecule, cleaving RNA of a GRID gene by contacting the cell with the novel nucleic acid molecule, an expression vector comprising a nucleic acid sequences (encoding at least the novel nucleic acid molecule in a manner that allows its expression), a manner that allows its expression), a manner that cell including the expression vector and an enzymatic nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule that releaves a condition associated with the level of GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is a target region for the enzymatic nucleic acids of the invention.
                                                New nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    enzymatic nucleic acid; RNA cleavage; hepatitis C virus; HCV; infection; type I interferon; DNAzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3.0%; Score 13.4; DB 1; Length 17; 93.3%; Pred. ö
from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence is a novel peptide nucleic acid (PNA), which acts as an inhibitor of mammalian, preferably human, telomerase. The PNAs hybridise specifically to an RNA component of mammalian telomerase, and include the sequence GGG for specific hybridisation to the template region of this component. PNAs can be used as probes to detect the RNA component of
                                                                         The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /mod_base= OTHER

The PNAs hybridise specifically to an RNA component of mammalian telomerase, and include the sequence GGG for specific hybridisation to the template region of this component. PNAs can be used as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, especially
mammalian telomerase and as inhibitors of telomerase activity, especially

The PNAs hybridise specifically to an RNA component of mammalian telomerase, and include the sequence GGG for specific hybridisation to the template region of this component. PNAs can be used as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, especially in the treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New peptide nucleic acids hybridising to mammalian telomerase RNA - used to inhibit telomerase, for treating tumours and other proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /nore= "sugar-phosphate backbone has been replaced by a peptide backbone"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Revised record issued on 21-OCT-2004 : Correction to feature table key

The present sequence represents a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomerase, and inhibits telomerase activity. Telomerase is a ribonucleoprotein enzyme that synthesizes one strand of the telomeric DNA, using as a template an ill conclectes now strand of the telomeric DNA, using as a template an ill conclectide sequence contained within the RNA component of the enzyme. The invention relates to PNA molecules having a sequence of no more than 25 concers, which include the sequence of TTAGG. The uncharged nature of the PNA increases the melting temperature of associating strands, increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. The corrects, neoplasia, hyperplasia, neurodegenerative diseases. The affords greater resistance of degradation by proteases conditions such as cancers, neoplasia, hyperplasia, neurodegenerative diseases. The diseases haracterized by abnormal telomere metabolism or telomerase diseases haracterized by abnormal telomere metabolism or telomerase diseases haracterized by abnormal telomer metabolism or telomerase cartivity, in combination with antineoplastic and other cytotoxic or cytostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention to be detected with increase and as inhibitors of telomerase activity. The method of the present invention can be used to detect an immortal or mechods of the present invention can be used to detect an immortal or mechods of the present invention can be used to detect an immortal or cell expresses telomerase activity and its RNA component
                                                                                                                                                                                                                                                                                                                                          New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a mammalian telomerase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide nucleic acid; PNA; telomerase; ribonucleoprotein enzyme; cancer; inhibitor; neoplasia; neurodegenerative disease; aging; hyperplasia; AIDS; HIV; fungal infection; forensic identification; detect; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            is an antitumour composition comprising the antitumour augmenting agent and an antitumour agent as effective components. The present sequence represents a hybridisable oligonucleotide for human RERF-LC-A1, used in the exemplification of the present invention. When the antitumour composition is administrated into a mammal, especially human, a sufficient antitumour effect is exhibited to cancer cells

nucleotice sequence contained within the KNA component of the anzyme. The invention relates to PNA molecules having a sequence of no more than 25 bases, which include the sequence GTTAGG. The uncharged nature of the PNA backbone increases the melting temperature of associating strands, increases the rate of association that targeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. The increases the rate of degradation by proteases or nucleases. The cherapeutic PNAs may be used for treating disease conditions such as cancers neoplasia, hyperplasia, neurodegenerative diseases, aging, human immondeficiency virus (HIV) infection/AIDS (acquired immunodeficiency virus (HIV) infection/AIDS are used for molecular diagnostics, labelled PNAs are used as hybridization or probes to detect or quantitate polymucleotides having a human telomerase and somitividuals. e.g. paternity testing, based on HTR sequence. PNA probes are also used for forensic identification of fragment length polymorphism (RPLP) pattern. PNAs are also useful as inhibitors of telomerase activity. The method of the present invention allows cancerous conditions to be detected with increased confidence and allows cancerous conditions to be detected with increased confidence and allows cancerous conditions to be detected with increased confidence and allows cancerous conditions to be detected with increased confidence and based on pathological characteristics. The diagnostic an immortal or methods of the present invented according any origin,

Telomerase is a ribonucleoprotein enzyme that synthesizes one strand of the telomeric DNA, using as a template an 11 nucleotide sequence contained within the RNA component of the enzyme. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a mammalian telomerase.
/*tag= a //*hote= "Peptide nucleic acid molecule, where N-(2-aminoethyl)glycine units are linked to nucleotide bases via glycine amino N through a methylenecarbonyl linker"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present sequence represents a peptide nucleic acid molecule which

```
The present sequence represents a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomerase, and inhibits ctelomerase activity. Telomerase is a ribonucleoprotein enzyme that extended the telomeric DNA, using as a template an 11 sourceotide sequence contained within the RNA component of the enzyme. The synthesizes one strand of the telomeric DNA, using as a template an 11 nucleotide sequence contained within the RNA component of the enzyme. The invention relates to PNA molecules having a sequence of no more than 25 backbone increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. The charapeutic PNAs may be used for treating disease conditions such as cancers, neoplasia, hyperplasia, neurodegenerative diseases. The characterized by abnormal telomere metabolism or telomerase communication with antineoplastic and other cytocoxic or sectivity, in combination with antineoplastic and other cytocoxic or cytostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization or cytostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization of individuals, e.g. paternity testing, based on hTR gene restriction of individuals, e.g. paternity testing, based on hTR gene restriction fragment length polymorphism (RFLP) pattern. PNAs are also useful as probes to detect the RNA component of a mammalian telomerase and as probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention allows cancerous conditions to be detected with increased confidence and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New peptide nucleic acid (PNA) compounds that inhibit telomerase activity
                                                                                                                                                                                                                                                                                                              cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   in mammalian cells is useful as probes to detect the RNA component of a mammalian telomerase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "Peptide nucleic acid molecule, where N-(2-aminoethyl)glycine units are linked to nucleotide bases via glycine amino N through a methylenecarbonyl linker"
